fully illustrated updated guide to the strategic design of green buildings in the tradition of

building construction illustrated francis d k ching and ian m shapiro offer a fully illustrated guide to the theory and practice of sustainable design this guide provides architects designers and builders in the green design professional community a framework and detailed strategies for designing substantively green buildings with a focus on sustainable sites approaching and reaching net zero energy low and zero water usage minimum impact materials and superior indoor environmental quality this guide explains why we need to build green as well as green building theory and advancements in the industry this second edition includes all new case studies featuring geographically diverse buildings with proven zero energy performance expanded coverage of zero energy building design as well as zero water and zero waste buildings practical guidance for the schematic design of high performance buildings heating and hot water system selection building envelope details and integrating renewable energy advanced strategies such as the concept of shape efficiency and the optimal location for stairwells in buildings additional strategies for affordability in green design and construction updated references to the latest codes and standards this second edition of green building illustrated is an excellent resource for professionals students and those interested in the design and construction of sustainable buildings conducting a systematic and comparative review of energy and

environmental issues especially at the regional and national levels can improve communication among different disciplines and be helpful for managers politicians and stakeholders involved in energy and environmental systems sustainable systems and energy management at the regional level comparative approaches provides an interdisciplinary look at the possible relationships which exist between energy and the environment relevant theoretical frameworks and the latest empirical research findings on the impacts of regulation policies market facilitation policies and communication models and policies are reviewed with the aim of improving understanding and strategy this timely volume brings together case studies that address the urgent need to manage energy use and improve thermal comfort in modern buildings while preserving their historic significance and character this collection of ten case studies addresses the issues surrounding the improvement of energy consumption and thermal comfort in modern buildings built between 1928 and 1969 and offers valuable lessons for other structures facing similar issues these buildings international in scope and diverse in type style and size range from the shulman house a small residence in los angeles to the td bank tower a skyscraper complex in toronto and from the calouste gulbenkian foundation a cultural venue in lisbon to the van nelle factory in rotterdam now an office building showing ingenuity and

sensitivity the case studies consider improvements to such systems as heating cooling lighting ventilation and controls they provide examples that demonstrate best practices in conservation and show ways to reduce carbon footprints minimize impacts to historic materials and features and introduce renewable energy sources in compliance with energy codes and green building rating systems the conserving modern heritage series launched in 2019 is written by architects engineers conservators scholars and allied professionals the books in this series provide well vetted case studies that address the challenges of conserving twentieth century heritage object oriented analysis and design for information systems clearly explains real object oriented programming in practice expert author raul sidnei wazlawick explains concepts such as object responsibility visibility and the real need for delegation in detail the object oriented code generated by using these concepts in a systematic way is concise organized and reusable the patterns and solutions presented in this book are based in research and industrial applications you will come away with clarity regarding processes and use cases and a clear understand of how to expand a use case wazlawick clearly explains clearly how to build meaningful sequence diagrams object oriented analysis and design for information systems illustrates how and why building a class model is not just placing classes into a diagram you will learn the

necessary organizational patterns so that your software architecture will be maintainable learn how to build better class models which are more maintainable and understandable write use cases in a more efficient and standardized way using more effective and less complex diagrams build true object oriented code with division of responsibility and delegation variable capacity heat pumps represent the next wave of technology for heat pumps in this report the performance of two variable capacity heat pumps hps is compared to that of a single or two stage baseline system the units were installed in two existing research houses located in knoxville tn these houses were instrumented to collect energy use and temperature data while both the baseline systems and variable capacity systems were installed the homes had computer controlled simulated occupancy which provided consistent schedules for hot water use and lighting the temperature control and energy use of the systems were compared during both the heating and cooling seasons multiple linear regression models were used along with tmy3 data for knoxville tn in order to normalize the effect that the outdoor air temperature has on energy use this enables a prediction of each system s energy use over a year with the same weather the first system was a multi split system consisting of 8 indoor units and a single outdoor unit this system replaced a 16 seer single stage hp with a zoning system which served as the baseline data was collected on

the baseline system from august 2009 to december 2010 and on the multi split system from january 2011 to january 2012 soon after the installation of the multi split system some of the smaller rooms began over conditioning this was determined to be caused by a small amount of continuous refrigerant flow to all of the indoor units when the outdoor unit was running regardless of whether they were calling for heat this coupled with the fact that the indoor fans run continuously was providing enough heat in some rooms to exceed the set point in order to address this the indoor fans were disabled when not actively heating per the manufacturer s recommendation based on the measured data the multi split system was predicted to use 40 more energy in the heating season and 16 more energy in the cooling season than the baseline system for the typical meteorological year weather data the ahri ratings indicated that the baseline system would perform slightly better than the multi split system but not by as large of a margin as seen in this study the multi split system was able to maintain more consistent temperature throughout the house than the baseline system but it did allow relative humidity levels to increase above 60 in the summer the second system was a split system with an inverter driven compressor and a single ducted air handler this unit replaced a 16 seer two stage hp with a zoning system data was collected on the baseline system from july 2009 to november 2010 and on the ducted inverter system from

december 2010 to january 2012 the ducted inverter system did not offer a zone controller so it functioned as a single zone system due to this fact the registers had to be manually adjusted in order to better maintain consistent temperatures between the two levels of the house the predicted heating season energy use for the ducted inverter system based on the measured energy use was 30 less than that of the baseline system for the typical meteorological year however the baseline system was unable to operate in its high stage due to a wiring issue with the zone controller this resulted in additional resistance heat use during the winter and therefore higher energy use than would be expected in a properly performing unit the ahri ratings would indicate that the baseline system would use less energy than the ducted inverter system which is opposite to the results of this study during the cooling season the ducted inverter system was predicted to use 23 more energy than the baseline system during the typical meteorological year this is also opposite of the results expected by comparing the ahri ratings after a detailed comparison of the ducted inverter system s power use compared to that of a recently installed identical system at a retro fit study hous this book written for the benefit of engineering students and practicing engineers alike is the culmination of the author s four decades of experience related to the subject of electrical measurements comprising nearly 30 years of experimental research and

more than 15 years of teaching at several engineering institutions the unique feature of this book apart from covering the syllabi of various universities is the style of presentation of all important aspects and features of electrical measurements with neatly and clearly drawn figures diagrams and colour and b w photos that illustrate details of instruments among other things making the text easy to follow and comprehend enhancing the chapters are interspersed explanatory comments and where necessary footnotes to help better understanding of the chapter contents also each chapter begins with a recall to link the subject matter with the related science or phenomenon and fundamental background the first few chapters of the book comprise units dimensions and standards electricity magnetism and electromagnetism and network analysis these topics form the basics of electrical measurements and provide a better understanding of the main topics discussed in later chapters the last two chapters represent valuable assets of the book and relate to a magnetic measurements describing many unique features not easily available elsewhere a good study of which is essential for the design and development of most electric equipment from motors to transformers and alternators and b measurement of non electrical quantities dealing extensively with the measuring techniques of a number of variables that constitute an important requirement of engineering measurement practices the book is

supplemented by ten appendices covering various aspects dealing with the art and science of electrical measurement and of relevance to some of the topics in main chapters other useful features of the book include an elaborate chapter by chapter list of symbols worked examples exercises and quiz questions at the end of each chapter and extensive authors and subject index this book will be of interest to all students taking courses in electrical measurements as a part of a b tech in electrical engineering professionals in the field of electrical engineering will also find the book of use efficient use and conservation of energy is a component of encyclopedia of energy sciences engineering and technology resources in the global encyclopedia of life support systems eolss which is an integrated compendium of twenty encyclopedias the volume on efficient use and conservation of energy discusses matters of great relevance to our world such as efficient use and conservation of energy in the industrial sector efficient use and conservation of energy in buildings efficient use and conservation of energy in the transportation sector efficient use and conservation of energy in the agricultural sector using demand side management to select energy efficient technologies and programs these two volumes are aimed at the following five major target audiences university and college students educators professional practitioners research personnel and policy analysts managers and decision makers and ngos provides the
