**Decision Analysis for Healthcare Managers** 2007 in recognition of the forgotten generation d l mulcahy pollen was long believed to serve primarily a single function that of delivering male gametes to the egg a secondary and generally overlooked value of pollen is that it serves to block the transmission of many defective alleles and gene combinations into the next generation this latter function comes about simply because pollen tubes carrying defective haploid genotypes frequently fail to complete growth through the entire length of the style however the beneficial consequences of this pollen selection are diluted by the fact that the same deleterious genotypes are often transmitted through the egg at strictly mendelian frequencies khush 1973 gene expression in the pollen might thus at least appear to be a phenomenon of trivial consequence indeed heslop harrison 1979 rightly termed the gametophytic portion of the angiosperm life cycle the forgotten generation this neglect however came about despite subtle but constant indications that pollen is the site of intense gene activity and selection for example mok and peloquin 1975 demonstrated that relatively heterozygous diploid pollen shows heterotic characteristics whereas relatively homozygous diploid pollen does not this was proof positive that genes are expressed that is transcribed and translated in the pollen 1 department of botany university of massachusetts amherst ma 01003 usa viii however the implications for pollen biology of even this recent and well known study were not widely recognized
